

Care & Cleaning Instructions

Cast Acrylic

Acrylic cast sheet has a highly polished lustrous surface, and will retain its fine appearance for many years if given proper care. Cleaning materials containing abrasives such as scouring powders or strong solvent as found in some window cleaning preparations should never be used to clean panels of Acrylic.

Benzene, ammonia, gasoline, acetone, carbon tetrachloride or denatured alcohol should never be used for cleaning Acrylic cast sheet, as these solvents tend to soften the surface and often cause crazing.

When first installed, glazing compound and masking paper adhesive can be easily removed from glazing of Acrylic with hexane, dry cleaning naphtha, kerosene or methanol. These solutions may be applied with a soft chamois or moist cellulose sponge.

Thereafter, an occasional washing with mild soap or detergent and water solution is sufficient to keep panes of Acrylic looking like new.

Fine hair scratches may be removed or minimized by the use of a mild automobile cleaner polish such as Du Pont No. 7 Polish. This cleaner polish has a very mild abrasive action and its wax content tends to fill small scratches and make them invisible.
